QUARTERLY MONITORING REPORT
(Quarter Ending September 30, 2005)

Dear Ms. Wahl:

PW Environmental (PW) prepared this Quarterly Monitoring Report for the property located at 1140 South Wells Road, Saticoy, on behalf Mr. John Bauer and Ms. Patti Collins, responsible parties (RP). Quarterly monitoring services were provided in compliance with the County of Ventura Environmental Health Division, Leaking Underground Fuel Tank Program letters dated October 4, 2002, and March 30, 2004. PW conducted this quarterly monitoring event on July 21, 2005. The work included measuring depth to water, calculating groundwater elevations, purging, and sampling four of four site wells (MW1 through MW4). The samples, a duplicate sample and a trip blank were submitted for analysis to a State-certified laboratory. The following report presents the work performed and the findings.

PW trusts this report addresses your current requirements. Please contact the undersigned if you have questions or comments regarding this report.

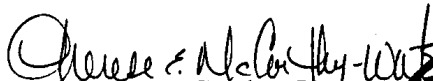

Respectfully submitted,

PW ENVIRONMENTAL

Andrew B. Nelson
Staff Geologist

QUARTERLY MONITORING REPORT

QUARTER ENDING SEPTEMBER 30, 2005

BAUER AND COLLINS PROPERTY
1140 SOUTH WELLS ROAD, SATICOY, CALIFORNIA
EHD SITE #C01033

1.0 WORK PERFORMED

On July 21, 2005, PW Environmental (PW) conducted monitoring and sampling of four of four site wells (MW1 through MW4). A duplicate groundwater sample was collected from well MW3R. The groundwater samples and a laboratory-supplied trip blank were submitted for analysis under Chain-of-Custody protocols to Positive Lab Service of Los Angeles.

2.0 CURRENT SITE ACTIVITIES

PW has completed four groundwater monitoring events (fourth quarter 2004 and first, second, and third quarters 2005) since completing remedial activities at the site in December of 2004. Based on the findings presented in PW's *Quarterly Monitoring Reports* for the first and second quarters 2005, PW recommended that the site be considered for low-risk closure. A response from the County of Ventura Environmental Health Division (EHD) is pending. Site description and background are presented in Appendix A.

3.0 FINDINGS

Well survey, hydrologic, and Global Positioning System location data obtained for the wells are presented in Table 1. Historical groundwater elevation and flow data are presented in Table 2. Laboratory analytical results for the groundwater samples collected for this event are summarized in Table 3. Historical laboratory analytical results for the site wells are presented along with the measured groundwater elevations in Table 4. Field methods, site background, and groundwater sampling protocol are presented in Appendix A. A data graph of historical groundwater elevations is in Appendix B. The Monitoring Well Field Data sheet and laboratory analytical results for the samples collected for this event are presented in Appendix C. A site location map is presented in Figure 1. The groundwater gradient map is presented in Figure 2. A tertiary-butyl alcohol (tBA) isoconcentration map is presented in Figure 3. A discussion of the groundwater conditions observed during the fieldwork and the laboratory analytical results for the groundwater samples is presented.

3.1 GROUNDWATER CONDITIONS

For this quarterly event, the measured depth to groundwater at the site ranged from 6.15 (MW4) to 6.28 (MW3R) feet below the top of the well casing. Groundwater elevations calculated for the wells were between 149.45 (MW3R) and 150.11 (MW4) feet above mean sea level. Historical groundwater elevations are shown in Graph 1 of Appendix B.

The groundwater flow direction and gradient were initially contoured using the computer contouring and drafting program SURFER[®], then modified as necessary based on interpretation of the data. Based on the groundwater elevations calculated during this monitoring event, groundwater under the site generally flows to the east at an approximate gradient of 0.0272 (or 2.7 feet of vertical drop over 100 feet of horizontal distance). The groundwater elevation contours and estimated flow direction from water level measurements obtained during this event are shown in Figure 2.

3.2 LABORATORY ANALYTICAL RESULTS

Submitted laboratory samples were analyzed as presented in paragraph 13 of Groundwater Sampling Protocols (Appendix A). The laboratory analytical results indicate that concentrations of tBA exceeding the Method Detection Limit (MDL) employed by the laboratory were reported in samples collected from well MW3R. The duplicate sample, collected from MW3R, contained concentrations of total petroleum hydrocarbons as gasoline (TPH-G) exceeding the MDL. These concentrations did not exceed the State Maximum Contaminant Levels.

Contaminant graphs for total petroleum hydrocarbon as gasoline and benzene are presented in Graphs 2 and 3 of Appendix B.

4.0 DISCUSSION

Comparison of the water level measurements for this event, with those measured during the previous event, indicate that the groundwater elevation under the site fell between 1.05 (MW2) and 2.63 (MW3R) feet. The calculated groundwater gradient under the site was 0.027 to the east. The groundwater gradient observed during previous monitoring events has predominantly been to the south.

Comparison of the laboratory analytical results reported for samples collected for this event are presented.

- In well MW1, located **up gradient** from the former underground storage tank (UST), concentrations of toluene decreased, while other contaminants remained below laboratory MDLs.

- In well MW2, located **cross gradient** from the former UST, concentrations of toluene decreased, while other contaminants remained below laboratory MDLs.
- In well MW3R, located **down gradient** from the former UST, concentrations of toluene, total xylenes, and tBA decreased, while other contaminants remained below laboratory MDLs.
- In well MW4, located **down gradient** from the former UST, concentrations of toluene decreased, while other contaminants remained below laboratory MDLs.

5.0 RECOMENDATIONS

- PW recommends that the site be evaluated and considered for a low-risk site closure;
- Hydrogen peroxide treatment, a site polishing method, to remove residual concentrations of select contaminants in the site wells, may be warranted prior to closure.

6.0 LIMITATIONS

Project limitations are presented in Appendix D.

TABLE 1

**WELL CONSTRUCTION, HYDROLOGIC, AND GPS DATA FOR JULY 21, 2005

APPENDIX A

SITE DESCRIPTION, BACKGROUND, AND GROUNDWATER SAMPLING PROTOCOL

SITE DESCRIPTION

The Bauer and Collins site is located at 1140 South Wells Road, east of the intersection of Aster Road and South Wells Road in Saticoy (Figure 1). The rectangular site is located in an area of mixed residential/commercial use and is bound by: residences to the north and east; an unpaved easement road and storm drainage channel to the south; and Aster Road to the west. The eastern two-thirds of the property is occupied by a single-story building that formerly operated as a commercial/retail awning construction and repair business. The western third of the property contains a paved area used for parking (Figure 2). The site is generally flat with a gentle surface gradient to the southwest.

SITE BACKGROUND

On October 11, 2001, PW Environmental (PW) removed one 550-gallon gasoline underground storage tank (UST; located adjacent to the west side of the building, near the southernmost building entrance) and associated plumbing from the site. During excavation activities, strong hydrocarbon odors and staining were observed in soil below and adjacent to the base of the UST. Laboratory analytical results for soil samples collected from the UST excavation indicated the presence of elevated concentrations of total petroleum hydrocarbons as gasoline (TPH-G) up to 1,800 milligrams per Kilogram (mg/kg) at 5 feet below ground surface (bgs) and total lead ranging from 16 to 20 mg/kg.

Based on site information and observed site conditions, the County of Ventura Environmental Health Division, Leaking Underground Fuel Tank Program (EHD) issued a letter dated January 30, 2002, requiring a preliminary site assessment be conducted to determine the extent of hydrocarbon contamination in the vicinity of the former UST. In response, PW prepared a *Soil and Groundwater Assessment Workplan* dated February 12, 2002. EHD approved this workplan in a letter dated March 8, 2002.

On May 1, 2002, three Geoprobe® soil borings (B1, B2 and B3) were advanced. PW was on site to collect and document soil and groundwater samples from each of the borings. At 5 feet bgs in the boring adjacent to the UST excavation, TPH-G was detected at 540 mg/kg and total lead ranged from non detect to 17 mg/kg. The results of this phase of investigation were presented in PW's *Soil and Groundwater Assessment Report*, dated June 27, 2002.

Based on the information presented in the June 27, 2002 report, EHD issued a letter, dated July 26, 2002, requiring the submittal of a workplan to verify the contamination identified at the site during the initial investigation, and preparation and submittal of a site-specific, Site Conceptual Model (SCM). PW submitted an *Additional Soil and Groundwater Assessment Workplan*, dated August 8, 2002. The workplan was conditionally approved by EHD in a letter dated October 4, 2002.

On January 21, 2003, four hollow stem auger soil borings were advanced in the vicinity of the former UST. The borings were completed as 2-inch diameter groundwater monitoring wells (MW1, MW2, MW3, and MW4). Laboratory analytical results reported for the soil samples

collected during well installation activities indicate that concentrations of TPH-G, ethylbenzene, and total xylenes exceeding minimum detection limits are present in site soil. Laboratory analytical results for the groundwater samples indicate the presence of dissolved lead, 1,2-dichloroethane (EDC), and TPH-G in the groundwater. The contaminant concentrations reported for the samples did not exceed State water standards action levels, or maximum contaminant levels, with the exception of EDC detected in the well down gradient of the former UST at a concentration of 5.3 micrograms per liter ($\mu\text{g/L}$). Based on the information generated during the additional soil and groundwater assessment and SCM, it appeared that minor soil and groundwater contamination existed beneath the site. Because the soil and groundwater contaminant plume had not been fully assessed in the lateral and vertical dimensions and active irrigation wells are located down gradient of the site, PW recommended drilling Geoprobe borings to further delineate the lateral extent of soil contamination, conduct site remediation by source removal, and continue quarterly groundwater monitoring. The work performed and findings were presented in PW's *Additional Soil and Groundwater Assessment Report*, dated March 10, 2003, and *Site Conceptual Model*, dated April 24, 2003. In response, EHD issued letters dated March 25 and June 20, 2003, accepting the results of the soil and groundwater assessment and SCM conducted, and required continued quarterly monitoring for the site. The letters also stated that data collected from consecutive quarterly monitoring events would support the consideration for low-risk closure.

Based on four quarters of groundwater monitoring data, EHD issued a letter dated January 8, 2004, notifying the RP that the site was to be evaluated for low-risk closure eligibility. The letter further stated that until concurrence from the Regional Water Quality Control Board is received, the quarterly groundwater monitoring program is to continue at the site. In a subsequent letter dated March 30, 2004, EHD directed that corrective action be performed in the source area to remove the residual hydrocarbon mass in the soil to be further protective of groundwater and of the nearby public supply wells located down-gradient of the source area. Until completion of the corrective action, EHD directed that the existing quarterly monitoring program continue at the site. In response, PW prepared *Corrective Action Plan* (CAP), dated May 24, 2004. The proposed workscope consist of: 1) conducting a limited hand auger assessment in areas adjacent to MW3 and in the former UST excavation pit to evaluate the required extent of the excavations to remove source soil; 2) completion of the remedial excavation using slot-cut method pending results from laboratory analytical results from the hand auger assessment; and, 3) collection of verification soil samples and submittal to a State-certified analytical laboratory for testing.

In a letter dated June 21, 2004, EHD approved the proposed workscope with these conditions: 1) eliminate hand auger borings and associated soil sampling; 2) extend excavation depths to nine feet below ground surface; 3) abandon well MW3 and excavate impacted soil surrounding the well; 4) following excavation activities, replace monitoring well MW3 in the immediate area for future groundwater monitoring; 5) modification to the dewatering plan to include direct dewatering if appropriate; 6) modified soil sampling plan for excavation areas; and, 7) perform two additional quarters of groundwater monitoring and sampling following completion of excavation activities. On August 26, 2004, PW abandoned groundwater monitoring well MW3. On September 10, 2004, PW initiated excavation activities in the vicinity of former monitoring well MW3. Based on field observations, additional soil removal was warranted. PW provided

the preliminary findings to EHD in *Remedial Excavation Preliminary Findings* report, dated September 23, 2004, and proposed extending the excavation. EHD approved the modified workscope except for extending the excavation to the east as proposed. From October 7 through 26, 2004, PW implemented the modified workscope and provided EHD with preliminary findings in a correspondence dated October 29, 2004. Based on the findings, PW recommended that residual soil, with elevated TPH-G concentrations (2,200 mg/kg) be removed. EHD approved additional soil removal in their correspondence dated November 3, 2004. PW initiated the modified workscope on November 16, 2004. Laboratory analytical results indicated TPH-G concentrations up to 1,200 mg/kg from the southern and eastern walls of the excavation at 6 feet bgs. Preliminary findings of the fieldwork were submitted to EHD in a facsimile on November 24, 2004, and discussed during a telephone conversation on November 29, 2004. PW prepared *Additional Remedial Excavation Work* letter report, dated November 30, 2004, proposing to excavate additional soil. In a facsimile and letter dated December 1 and 3, 2004, respectively, EHD approved the modified workscope.

On December 3, 2004, following completion of excavation activities outside the structure, PW proceeded with the installation of one groundwater monitoring well in the location of former well MW3 (MW3R). During the period of December 6 through 9, 2004, PW proceeded to complete the modified workscope approved by EHD. Confirmation soil samples collected on December 6, 2004, indicated non-detectable or concentrations of TPH-G below EHD cleanup levels established for the site (300 mg/kg). PW provided the preliminary findings to EHD in a facsimile dated December 7, 2004, indicating that the extent of the excavation had been completed. Between December 7 and 9, 2004, PW completed backfill activities and resurfaced inside the structure with concrete. PW's findings were presented in the *Remedial Excavation Report*, dated January 25, 2005. Four quarterly groundwater monitoring events have been performed (including third quarter 2005) since the completion of remedial activities at the site. Based on the findings from the first quarter 2005 monitoring event, PW recommended that the site be considered for low-risk closure. A response from EHD is pending.

GROUNDWATER SAMPLING PROTOCOL

Quarterly monitoring activity at the Bauer and Collins Property includes monitoring and sampling four site wells (MW1 through MW4). The following procedure details the routine purging and sampling of groundwater monitoring wells. These activities are based on the *California Water Well Standards*, Local Oversight Agency (LOP) regulations and directives, and experience.

1. All pump/bailer components are steam-cleaned, or washed in ALCONOX® cleaner, or equivalent, before and between development and purging of separate wells.
2. Appropriate purge volumes are calculated through the following steps:
 - a. Measure depth to groundwater (static groundwater level) using a clean, electronic water-level indicator, interface probe, or equivalent, to the marked datum point on the top of the well casing, recorded to 0.01-foot.
 - b. **Measure all site-related wells prior to purging** any of the site wells. If groundwater conditions are known, measure wells from the least to the most impacted. **If product is evident, DO NOT PURGE OR SAMPLE THE WELL.**
 - c. If liquid-phase hydrocarbon FFP is suspected or known, use a product/water interface probe for measurement.
 - d. After measuring the depth to water, lower the electronic water-level meter, or a clean tape and plumb bob, to measure and confirm the well depth and sediment that may have settled in the well, if necessary.
 - e. Calculate one casing volume using total water depth in well for purging ($\pi r^2 h \times 7.4805$ gallon/ft³ - with values in feet, where r is the radius of the well and h is the net feet of water in the well). For initial well development, include annular (well volume) space for volume calculation:

$$[(\pi b^2 h - \pi r^2 h) \times \rho] + \pi r^2 h \times 7.4805 \text{ gallon/ft}^3,$$

where b is the borehole radius, and ρ is the assumed porosity of the filter pack (~35%).

Some agencies require the extraction of boring volumes for well purging instead of casing volumes. Use the above for well development calculation when boring volume is required.

3. Prior to sampling, three well volumes (the usual minimum) are purged from each well to ensure that water sampled is representative of the groundwater from the formation. If the well does not "clean up" to the *NTU* (Nephelometric Turbidity Unit) acceptable value (5 to 10 percent) to a satisfactory percent of suspended material (by *Imhoff Cone*, or *NTU* value), a surge block should be used to assist with purging. If the well has not been

sampled or developed for over one year, the well should be surged and re-developed, as described in paragraph 2e.

4. Measurements of pH, temperature, (turbidity in NTUs, as necessary) and conductivity/hardness must be recorded at frequent intervals during the purge; when these parameters stabilize, purging should be complete. Measure values with a Horiba® U10, standard Hydac® CTpH Tester, or equivalent meter.
5. If a well is pumped dry, a representative sample can be collected: 1) once the water level recovers to 80 percent of the initial water column measured in the well, or 2) after 2 hours, whichever occurs first. Surging the well may be necessary to stimulate flow in fine-grained soils.
6. Development/purge water is stored in **labeled** D.O.T. 55-gallon drums, or other appropriate container, and retained on site until the proper disposal method is approved. Non-detect purged waters may remain on site to evaporate, used for landscape irrigation, dust control, or other uses as approved by LOP.
7. Sampling can commence once the well recovers to 80 percent of the static condition. The allowable static groundwater condition is calculated by subtracting 80 percent of the initial measured water column from the total well depth [e.g. water column = 20 feet; WTD = 50 feet; $50 - (20 \times 0.8) = 34$ feet DTW]. If the well does not recover within two hours after purging, the well can be sampled when enough water is present to collect the required sample.

Use a pre-cleaned disposable bailer, dedicated bailer, or a cleaned, re-usable Teflon® bailer, for sampling. With the depth to water measured, the bailer is lowered slowly into the well so that only one-half of the bailer enters the groundwater. This allows for inspection/ observation of the groundwater surface upon retrieval.

8. Groundwater samples are immediately transferred from the bailer, through a bottom-emptying valve, into 40 ml VOA sampling bottles. At least three VOA bottles are filled per well, with preservatives, as directed or required, and sealed with Teflon-septa cap. VOAs should be filled until the water develops a positive meniscus. Fill VOAs first, then the remaining plastic or amber bottles (for lead, diesel analyses).
9. A blind **duplicate** sample should be collected per every 10 samples, or as directed by the LOP; for 2 to 10 samples, collect one duplicate sample. A laboratory-supplied **trip blank** must accompany every sample container. VOAs must be immediately placed in a cooler chilled to approximately 4°C, for transport to the state-certified analytical laboratory. A protected travel thermometer may also be placed in the chilled cooler to verify temperature. Samples are usually delivered to the state-certified laboratory on the same day as collected or within 24-hours of sampling.

10. A Chain-of-Custody (COC) form that documents the time, date, analytical methods, and responsible person during each step of the transportation process accompanies samples. The COC is completed in the field.
11. Groundwater-sample containers are clearly labeled to show: a unique project identifier; well number; sample sequence (if applicable); time and date sampled; added preservative; analytical methods (if space allows); and sampler's initials. An indelible non-water soluble marking pen is used to label all containers.
12. Should problems develop regarding this protocol, field operations, or sampling conditions, the Project Manager is immediately notified.
13. Specifically, the groundwater samples collected from the site wells are analyzed for:
 - a. Total petroleum hydrocarbons as gasoline using EPA Method 8015M
 - b. Benzene, toluene, ethylbenzene, total xylenes (BTEX), methyl tertiary-butyl ether (MtBE), tertiary-butyl alcohol (tBA), tertiary-amyl methyl ether (tAME), di-isopropyl ether (DIPE), and ethyl tertiary-butyl ether (EtBE) by EPA Method 8260B.
 - c. The duplicate sample and trip blank were submitted and analyzed for BTEX, MtBE, tBA, tAME, DIPE, and EtBE by EPA Method 8260B.

Report No.: 5070155
Project Name: Bauer, 1140 S. Wells Rd., Saticoy, CA

Dear Mr. Robert Orlando,

This report contains the analytical results for the sample(s) received under chain of custody(s) by Positive Lab Service on July 22, 2005.

The test results in this report are performed in compliance with ELAP accreditation requirements for the certified parameters. The laboratory report may not be produced, except in full, without the written approval of the laboratory.

The issuance of the final Certificate of Analysis takes precedence over any previous Preliminary Report. Preliminary data should not be used for regulatory purposes. Authorized signature(s) is provided on final report only.

If you have any questions in reference to this report, please contact your Positive Lab Service coordinator.

A handwritten signature in black ink, appearing to read "James [unclear]", is written over the printed text "Project Manager".

APPENDIX D

LIMITATIONS

LIMITATIONS

This report, including all attached exhibits, describes results of all or a portion of PW Environmental's investigation into subsurface conditions at the subject site. The findings and recommendations are based on the application of a variety of scientific and technical disciplines to data developed regarding the subject property. The data was developed by observation, sampling, and gathering of information (both documentary and oral) about the property. Some of this data is subject to change over time. Some of this data is based on information not currently observable or measurable, but recorded by documents or orally reported by individuals. The findings and recommendations are based, in part, on application of sampling techniques. Said techniques inherently involve a risk of overstating or understating the presence or severity of contamination. The findings and recommendations are based also on sampling only for the specific contaminants shown in the laboratory reports. The samples taken were not subjected to testing for every contaminant known to the environmental industry, and every biological and/or chemical condition known to the environmental industry.

PW Environmental is not responsible for the accuracy of data not developed by PW Environmental or its agents or subcontractors. PW Environmental is not responsible for overstating or understating the presence or severity of contamination. PW Environmental is not responsible for failing to test for contaminants or biological/chemical conditions it had no reason to know were of concern at the subject site.

PW Environmental has performed this investigation in a professional manner using that degree of skill and care exercised for similar projects under similar conditions by reputable and competent environmental consultants. No warranty, either expressed or implied, was made. PW Environmental is not responsible for the ramifications caused by the concealment, withholding or failure to disclose of relevant information known to anyone contacted by PW Environmental in connection with its work at the subject site. This report and all field data, notes, laboratory test data on which it is based (hereinafter collectively designated "Information") were prepared by PW Environmental solely for the benefit of PW Environmental's client Mr. John Bauer and Ms. Patti Collins. Mr. John Bauer and Ms. Patti Collins have the legal right to release all or a portion of this Information, in its discretion, to third parties. Said third parties may not have access to all information upon which this report was based, nor access to prior reports, nor to other information developed and not placed in any report (hereinafter collectively designated "Additional Information"). The presence or absence of such Additional Information may materially affect the statement contained in this report. Any use or reliance upon this report of Information by a party other than the Mr. John Bauer and Ms. Patti Collins, therefore, shall be solely at the risk of such third party and without legal recourse against PW Environmental, its employees, officers, or directors, regardless of whether the action in which recovery of damages is sought based upon contract, tort, statute or otherwise.
